

Abstract of the Disclosure

A method for modeling medical conditions in a person includes providing a plurality of profiles relating predetermined medical conditions to human
5 body parts. Each profile describes an estimated capacity of at least one body part, due to at least one condition, over time. One or more of the medical conditions are identified that affect the person. A profile corresponding to each medical condition is
10 selected, and the selected profile's time dimension is related to the occurrence of the medical condition.
